Performance Beyond Your Expectations!

Underground Utility Construction

CE Corporation offers a full range of underground construction, including drilling, trenching, utility locating and utility potholing services.

The application of Horizontal Directional Drilling has eliminated many of the drawbacks of trench excavation.

To complement the HDD we have several vacuum excavators to "pinpoint" existing utilities to minimize damage.

This unit uses high pressure water jets and vacuum action to excavate straight down to the marked utility. Since it uses water to displace the soil, no damage is inflicted on the target.

We are an innovator in the HDD field performing directional drilling and trenching. We continue to take on the toughest drilling and trenching challenges to accomplish our customers goals.

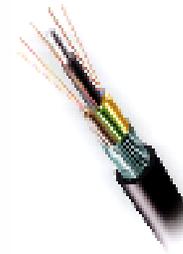

Utility Locating and Mapping

We specialize in locating publicly and privately owned utility lines and other subsurface structures. We employ all of the latest technologies including traditional locating techniques, Ground Penetrating Radar (GPR), fiber optic pipe inspection cameras, and acoustic detection.

Aerial Utility Construction

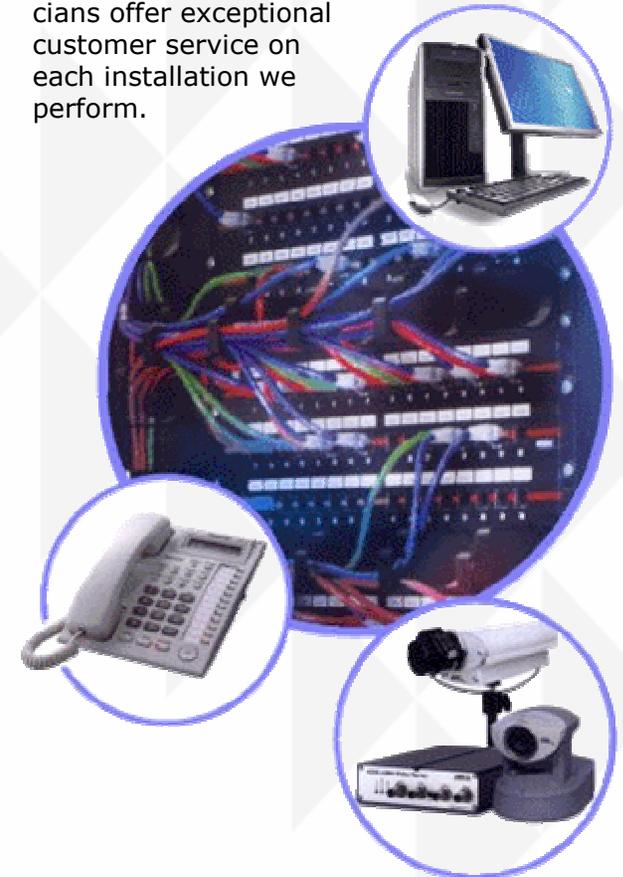

CE Corporation has the capacity to meet all your aerial needs whether it is strand, copper, fiber, coax, cable aerial utilities removal and wreck-out.

Voice and Data Solutions

CE Corporation serves as your single source for voice, data and optical fiber communications cabling. Whether it's pre-wire for

new construction or post wire for existing business. We have the resources and skilled personnel to manage your project from start to finish. Our highly trained technicians offer exceptional customer service on each installation we perform.

"Serving the entire Mid-Atlantic area."
